Researchers and policymakers alike recognize the lasting benefits of participation in high-quality arts coursework and in integrating arts into other content areas. Federal policymakers signaled their support for arts education by passing the Every Student Succeeds Act, with its inclusion of the arts as part of a "well-rounded education." Yet many states and districts still lack the data or resources to ensure that all students have equitable access to arts opportunities.

The Arts Education Partnership at the Education Commission of the States houses more than 280 summaries of research on the impact of arts education. Collectively, the findings point to improved outcomes for students, educators, and schools. For example, students who participate in the arts demonstrate enhanced writing and reading skills, postsecondary success, and improved test scores. Integration of the arts into other subject areas, such as math or history, increases engagement and facilitates learning. Arts education helps students recall and retain information and fosters problem solving, persistence, creativity, and critical thinking.

The effects of learning in the arts are even more pronounced for historically underserved students. English language learners and students from low-income backgrounds who engage in the arts are more likely than their peers who did not have access to arts opportunities to complete high school, have a higher GPA, and attend and finish college. Arts learning connects students to cultural and social values, with greater effects for students from low-socioeconomic backgrounds. When engaged in the arts, students are more likely to be civically engaged than peers who do not have exposure to the arts.

Discovering Gaps

States vary in their arts education data collection and reporting, and state boards of education and state education agencies often do not have access to consistent, reliable data to inform policy. While many states collect data on course availability and enrollment, teacher assignment to arts courses, and instructional hours devoted to the arts, most do not report those data publicly. As of October 2019, 13 states publish data on arts enrollments in arts courses. California and New Jersey were early leaders in developing online data systems that include information on arts education.

The Statewide Data Infrastructure Project for Arts Education, a partnership between the National Endowment for the Arts and Education Commission of the States, bridged the gaps in arts education and state data systems through reports and technical assistance to help empower policymakers and communities with the necessary information to help ensure all students have access to arts education. Through the project, states like Nevada, Rhode Island and Louisiana received technical assistance to help them with issues like improving quality of their data, requesting data for analysis and helping establish a data collection and reporting agenda that aligns with goals for arts education (see article, page 13).

Policy Levers

Beyond encouraging better data collection and reporting on arts learning, state boards can partner with state advocates and legislators in other ways to help improve access to the arts in education. Key policy areas in arts education span learning standards, instructional requirements, high school graduation requirements, assessment, state accreditation, teacher licensure requirements for non-arts and arts teachers, and grant funding (figure 1).

All 50 states and the District of Columbia have adopted arts education...

requirements for high school graduation but have adopted policies in implementation. Twenty-five states have adopted policies for arts education requirements for high school graduation but have varying approaches in implementation. Some states, such as Florida, allow speech and debate or practical arts—defined as a course that incorporates artistic content, techniques of creativity, interpretation and imagination—to meet this requirement. Other states, such as Kansas, defer to local school boards to define courses eligible to meet the requirement. Maryland regulation specifies that students earn the credit by completing a course in visual arts, music, theater, or dance.

Beyond these areas, policymakers have increased their focus on STEAM as an approach to advance skill development and achievement in fast-growing occupations in the arts and STEM fields. STEAM education is defined as an approach to teaching in which students demonstrate critical thinking and creative problem solving at the intersection of science, technology, engineering, arts, and math. Through these five subject areas, students build new understanding and solve problems that are authentic to their lives. While some states began adopting STEM policies more than 20 years ago, many states have only recently adopted STEAM-related policies.

For example, in 2017, the Nevada legislature passed a bill establishing a statewide diploma seal for student achievement in STEAM. Nevada also established a subcommittee of the STEM Advisory Council to support professional development and increase access to high-quality STEAM education throughout the state. Georgia and Ohio expanded systems for STEM school certification to include the arts to recognize schools and programs for their commitment to STEAM education. An Ohio state statute designates STEAM as a type of STEM school and authorizes the STEM committee to review proposals for STEAM certification. In contrast, the state education agency upholds Georgia’s STEAM school certification.

State boards have the opportunity to support, promote, and adopt arts-related policies to expand access to the arts in high-needs districts and schools, including arts integration. They can also include the arts in approaches to ensuring a well-rounded education and providing targeted professional development for educators focused on the arts. From arts education standards and high-school graduation requirements to related policy areas like STEAM, state boards can affect the quality of arts education in their states and ensure that all students have equitable access to arts opportunities.
